This New American Red Cross CPR/AED for the Professional Rescuer Participant's Manual and course reflect changes based on the 2005 Consensus on Science for CPR and Emergency Cardiovascular Care (ECC) and the Guidelines 2005 for First Aid. Changes to this program and manual include simplifications to many of the CPR skill sequences, which helps improve retention. There have also been changes to help improve the quality of CPR. The integration of CPR skills into the operation of AEDs had changed to help improve survival from sudden cardiac arrest. Professional rescuers are now trained to use AEDs on adults and children. Information has been updated and added to this program to help professional rescuers administer epinephrine, aspirin and fixed-flow-rate oxygen. The skills learned in this course include adult, child and infant rescue breathing, conscious and unconscious choking, CPR, two-rescuer CPR and adult and child AED. Additional training can be added to this course including bloodborne pathogens training and emergency oxygen administration. While the skills and knowledge that professional rescuers use are increasing, this training will help you meet your most important responsibility as a professional rescuer- the responsibility to save lives.

20-1132

Abstract: Sudden cardiac arrest is the leading cause of death in the United States. Research has shown that providing immediate high quality CPR may improve patient's survival. Although we know high quality CPR may improve outcomes from sudden cardiac arrest, data still shows CPR patients are receiving is inadequate. Data suggest health care professional's CPR skills deteriorate quickly upon completion of basic life support training. Skills decline as soon as 2-3 weeks following initial training. This study aimed to determine if using objective feedback during initial adult basic life support training in combination with a practice session using objective feedback would improve student CPR skills. Students were randomized to either use a traditional CPR manikin during initial adult CPR training or an objective feedback manikin. Students randomized to use the objective feedback manikin were asked to participate in a CPR practice session 6 weeks after completing their initial CPR course. During the practice session students were asked to use objective feedback to correct their skills. While student's practiced their skills, they were timed to see how long it would take them to perform CPR in accordance to the 2005 AHA guidelines for CPR and ECC for 2 minutes. To satisfy this requirement, students must perform CPR within the recommended guidelines for ventilation rate, chest compression rate and depth, as well as no flow fraction. All participants were asked to return at 12 weeks for final testing. The ResusciAnne skillreporter manikin was used to collect objective CPR compliance data. Seventeen students participated in the study, 9 treatment and 8 control participants. Due to lack of instructor compliance, determining whether using objective feedback for initial training had an impact on student skills is not answerable. There were no significant differences found in student's CPR skills between those who did and did not participate in the objective feedback CPR practice session.
