Power Systems Design and Studies. NREL develops new tools, algorithms, and methods for modeling, simulating, and designing the electric power system at all scales. This includes market design and performance evaluations; and planning, operations, and protection studies. Current design and planning tools for the electric grid cannot handle uncertainty, rely on simplifying the underlying physics of power systems, and are typically run on desktop personal computers or small servers.

Power system design is the process of fully designing, on paper, the electric system before beginning to place contracts for equipment order and construction. The design process can range from a simple Single Line Diagram with supporting notes up to complex packages that specify everything down to cable gland sizes.

~~Electrical system design - Wikipedia~~

Power from generation plants is carried first through transmission systems, which consist of transmission lines that carry electric power at various voltage levels. A transmission system corresponds to a networked, meshed topology infrastructure, connecting generation and substations together into a grid that usually is defined at 100 kV or more.

During this course, the student will learn the different aspects of power systems: from the development of electrical energy systems (long term planning) up to real time operation. The first part of the course focuses on the modeling and simulation of modern power systems. This includes the dynamic modeling of power components and their controls.
